```

****conclusion:**

In our experience, Single-layer perceptron can reach up to very high accuracy, 100% in some cases, however, the average accuracy of adaline algorithm is higher which is expected since while both algorithms are linear classifiers, Adaline is more versatile and can handle a broader range of problems, including those that are not linearly separable.

We also noticed that some features when used give higher accuracy than others, same thing with some classes when used together.

****features achieved the highest accuracy after running Perceptron:**

“Area” and “Perimeter” with accuracy 1.0 when used with “BOMBAY” and “CALI” classes

****features achieved the highest accuracy after running Adaline:**

“roundnes” and “perimeter” with accuracy 0.8 when used with “BOMBAY” and “SIRA” classes
